

Cloudigle – First Scenario

Group 4 – Ayna Jain, Tirth Patel, Akshant Jain, Shaan Shekhar

The Cloudigle platform will eventually allow its users to collaborate on any kind of project seamlessly using its cloud-based functionality, providing an easy to use platform for conducting agile software development. Unlike other platforms, Cloudigle will provide pre-built templates depending on the type of the project, which are non-gimmicky and useful for the developers to get started faster and move quickly in their projects.

Secondly, Cloudigle will take into consideration user feedback, and improve the platform based on the liking and ease-of-use for the users. Historically, agile platforms have been these sophisticated online platforms that work just fine, but have a steep learning curve. Cloudigle, on the other hand, tries to make agile development very simple to use and reduces that steep learning curve.

Scenario - “New User”

When a new user lands on our product page, the user sees who we are and what Cloudigle provides. The login form will be displayed to the user on one side of the page and after validation, they will be redirected to their dashboard. For new users, there will be a sign in form where a user can sign up with their email address or with Single sign-on through Gmail or GitHub.

On successful sign up from a new user, they will be redirected to a brief tutorial that introduces our functionality such as create projects, current projects, voice chat, video chat, messaging chat, suggestions, setting reminders and git integration.
