Cloudigle – Second Scenario

Group 4 – Ayna Jain, Tirth Patel, Akshant Jain, Shaan Shekhar

The second scenario largely adds up on the tasks achieved previously, which includes polishing the UI design, and adding other advanced product features on the dashboard for the large part, and adding attributes for project management, which is inline with the project backlog and project member management features.

Scenario: "More Advanced Features"

The users have the ability to see their projects on their dashboard along with certain details of the project such as the client of the project or the last recent update. The user can now directly create a new project from their dashboard and invite people through Github or Gmail. On clicking a project, the user can go to their respective project page where they can view and set their product backlog, chat with their team members, set reminders, view current progress and have features to manage git directly from Cloudgile.

The dashboard is now customizable and users can set their dashboard according to their preferences. There will be a search bar on each page of the application that allows searching the entire application. The chat feature has been implemented which has the ability to send messages and locations to all the group members. Also, the group name and members are visible on the side of the tab. By the second release, the users will have the ability to share media and important documents to individual members or to a group. The chat tab will allow the users to share screens.

Moving forward, the addition of the necessary features in the project and account settings is inevitable. From the most basic features of personalizing the user profile like selecting a personal unique username, changing avatars, and theme selection according to the liking of the user, to advanced features like project backup, billing and plans, account privacy settings will be implemented.

Prototype diagrams:

	Project name	Project type	Project lead	Project category	URL
